

Privilege Escalation Log

Target: VulnHub VM

Tools Used

- Meterpreter
 - LinPEAS
 - PowerSploit
-

Escalation

Steps:

1. Ran LinPEAS:
`./linpeas.sh`
 2. Identified vulnerable SUID binary:
`find / -perm -4000 2>/dev/null`
 3. Exploited misconfigured binary to execute commands as root
 4. Gained **root shell access**
-

Persistence

Established persistence by creating a malicious cron job that executes a reverse shell script at regular intervals. The cron task ensured continuous access even after system reboot. This technique leveraged legitimate scheduling functionality, making detection difficult while maintaining long-term unauthorized control over the compromised system.
